SUMMARY

Results-driven Java Backend Developer with 2.5+ years of experience at TransUnion building and supporting high-throughput financial data systems with Java, specifically specialized in CIBIL parameter configuration. My expertise lies in designing scalable server-side architectures, optimizing complex database queries, and ensuring the precision of credit scoring algorithms critical to the Brazil region's consumer financial landscape.

EXPERIENCE

TransUnion

Intern **Feb 2023-June 2023**

During my experience in backend development, I focused on architecting and building robust server-side solutions using the Spring Boot framework. This involved designing efficient RESTful APIs, managing complex business logic, and ensuring seamless communication with the database to maintain data integrity and performance.

Associate Developer **Aug 2023 – Present**

- Owned the end-to-end lifecycle of CIBIL parameters — analyzing and configuring backend data structures across on-premises and staging (STG) environments to ensure 100% data consistency across all deployments.
- Gave production support for critical client-reported defects- Sometimes I performed rapid root-cause analysis and deploying fixes that maintained zero-downtime workflows for high-priority financial data pipelines.
- Optimized database mapping logic within the source code, reducing data-retrieval latency and measurably improving application performance and data integrity.
- Served as the key technical resource for cross-environment debugging, partnering with QA and DevOps teams to detect and resolve incidents before they reached client escalation.
- Designed and implemented comprehensive unit and integration testing strategies using JUnit and Mockito, ensuring high code coverage and stabilizing the application against regression during rapid development cycles.

TECHNICAL SKILLS

Languages: Java, SQL
Backend: Spring Boot 3,Spring Data JPA, REST APIs, JWT Authentication, Microservices
Frontend: React.js 18, JavaScript (ES6+), Vite
Databases: PostgreSQL, MySQL
Tools & Practices: Git, GitHub, Maven, IntelliJ IDEA, Postman

EDUCATION

Vishwakarma Institute of Technology, Pune Aug 2019 – Aug 2023
Electronics and Telecommunication Engineering CGPA-8.38

PROJECTS

BNPL (Buy Now, Pay Later) System | *View on GitHub*
Tech Stack: Spring Boot 3, React.js, PostgreSQL, Spring Batch, Spring Data JPA

- **Architected an end-to-end Buy Now, Pay Later platform** replicating LazyPay/Simpl, enabling instant EMI splits (3/6/12 months) at checkout with 0% interest options.
- **Built a rule-based credit-scoring engine** weighting income (30%), debt-to-income ratio (25%), and credit history (30%) to dynamically assess borrower eligibility.
- **Implemented an EMI calculator using the reducing-balance formula** and integrated Spring Batch to automate daily deductions, overdue-penalty application, and weekly NPA flagging.
